

Smart Event Planner

+ Budget Tracker

Baseline Features Document

1. Project Overview

A web-based event planning application that allows users to create and manage personal or professional events with AI-assisted task planning and real-time budget tracking. The system supports multiple event types and guides users from initial planning through post-event expense reconciliation.

2. Supported Event Types

The application must support the following event categories at minimum:

- Wedding
- Birthday Party
- Corporate Event
- Baby Shower
- Graduation
- Custom / Other (user-defined label)

3. Core Features

3.1 Event Creation & Profile

Feature	Description
Event Name	A user-defined title for the event.
Event Type	Selection from supported event categories.
Event Date	Target date for the event.
Guest Count	Expected number of attendees.
Location	City or venue name for the event.
Total Budget	The overall budget cap set by the user in PKR or USD.

Event Description	Optional notes or additional context about the event.
-------------------	---

3.2 AI-Generated Task Checklist

Upon event creation, the system generates a structured checklist of tasks tailored to the event type, date, and profile.

- Tasks are grouped into planning phases: Pre-Planning, Preparation, and Day-Of.
- Each task includes a recommended completion deadline relative to the event date.
- Tasks are ordered by urgency and dependency.
- The checklist accounts for lead time — e.g. if the event is 3 months away, early-stage tasks are prioritized.
- Users can mark tasks as complete, pending, or skipped.
- Users can add, edit, or delete tasks manually.

3.3 Vendor Category Suggestions

The system suggests relevant vendor categories based on event type, along with a recommended budget allocation percentage per category.

Feature	Description
Category Name	e.g. Catering, Venue, Photography, Decor, Entertainment, Transport.
Suggested Budget %	AI-recommended percentage of total budget per category.
Allocated Amount	Calculated from budget % and total budget — editable by the user.
Notes	Optional field for vendor-specific notes or requirements.

Vendor categories are editable. Users can add, rename, or remove categories.

3.4 Timeline Generator

A milestone-based timeline is generated from the event date, working backwards to the current date.

- Milestones are derived from the task checklist phases.
- The timeline reflects the actual time available — shorter lead times compress the planning phases accordingly.
- Completed tasks update the visual progress of the timeline.
- The timeline is viewable in a chronological list format.

3.5 Expense Logging

Users log individual expenses against vendor categories throughout the planning process.

Feature	Description
Vendor / Item Name	Name of the vendor or specific expense item.
Category	Links the expense to a vendor category.
Estimated Cost	Expected cost at the time of planning.
Actual Cost	Final or invoiced amount paid.
Payment Status	Paid, Pending, or Partially Paid.
Date Logged	Date the expense was recorded.
Notes	Optional field for receipts, contacts, or reminders.

3.6 Budget Tracker

A real-time dashboard view showing financial health across all categories.

- Total budget vs. total spent displayed prominently.
- Per-category breakdown: allocated budget vs. actual spend vs. remaining.
- Visual chart showing budget distribution across vendor categories.
- Over-budget categories are flagged with a warning indicator.
- Overall budget status: Under Budget, On Track, or Over Budget.

3.7 Progress Dashboard

A summary screen providing a snapshot of event planning status.

- Task completion percentage.
- Number of tasks overdue, upcoming, and completed.
- Budget health summary.
- Days remaining until the event.
- Quick-access links to pending tasks and unfilled vendor categories.

4. User Management

- User registration and login with email and password.
- Each user has a personal dashboard with all their events.
- Multiple events can be managed simultaneously per user.
- Event data is private to the creating user.

5. Core Data Entities

Feature	Description
User	Account credentials and profile information.
Event	Event details, type, date, guest count, budget, and status.
Task	Task name, phase, due date, status, and event reference.
Vendor Category	Category name, allocated budget, and event reference.
Expense	Expense details, cost fields, payment status, and category reference.

6. Out of Scope (Baseline)

The following are explicitly excluded from the baseline version:

- Vendor marketplace or directory listings.
- Payment processing or invoice generation.
- Multi-user collaboration on a single event.
- Guest list management or RSVP tracking.
- Email or SMS notification system.
- Mobile application (web only at baseline).
- Social sharing or public event pages.

7. Baseline Acceptance Criteria

The project is considered baseline-complete when all of the following are true:

- A user can register, log in, and log out.
- A user can create an event with all required profile fields.

- AI-generated tasks are displayed immediately after event creation, organized by phase.
- Vendor category suggestions are displayed with budget allocations after event creation.
- A user can log, edit, and delete expenses against any vendor category.
- The budget tracker reflects real-time totals as expenses are logged.
- Over-budget categories are visually flagged.
- The progress dashboard displays task completion and budget status.
- A user can manage multiple events independently.
